Key Skills

ASP.NET (C#)	10+ years
Entity Framework	8 years
Linq	8 years
Visual Studio	10+ years
SQL Server	10+ years
SQL	10+ years
JavaScript	10+ years
HTML	10+ years
CSS	10+ years
Blazor	4 years
MudBlazor	3 years
ASP.NET MVC, Razor, Bootstrap, Identity Server, xUnit	Good

Also **Docker**, **LinqPad**, **Teams**, **PowerShell**, **DevOps**, **Slack**, **Exceptionless**, **WebAPI**, **Scalar**, **Copilot**, **RAG AI (document-aware retrieval-augmented generation)**, **LLM Integration (Ollama plus local models)**, **GitHub Actions**, **CI/CD**, **Jenkins**, **Playwright**, **IIS**, **MySQL**, **WPF**, **AWS**, **Localstack**, **S3**, **MinIO**, **Azure Static Web Apps**, **SPA Telemetry** (**Google Analytics GA4 Instrumentation)**.

Personal Profile

With 10+ years' experience in web application development using C# and SQL Server with a variety of front end technologies including MVC, Razor and Blazor I am well qualified to take any requirements and develop applications which will meet – or exceed – business expectations.

Talking to the business to understand workflows and suggest additional functionality to make their lives easier comes as standard!

I'm also very happy to share my experience with colleagues and to mentor where required and have done so very successfully in the past.

History

01/2025 – Date: Studying and up-skilling

I have been using my time for full-time job hunting and up-skilling myself – including building an application using AWS (Localstack DynamoDb and S3 and MinIO) cloud technologies and learning Playwright, Docker, CI/CD, Jenkins, GitHub Actions, document-aware RAG AI with Ollama and various local LLMs.

I have also redesigned and deployed my web site as a cloud-native Static Web App using GitHub Actions, Azure Static Web Apps, and Blazor / MudBlazor, including CI/CD pipelines, environment configuration, and telemetry using Google Analytics (GA4). (jaburrow.co.uk)

04/2023 - 12/2024 : STM Group – C# ASP.NET SQL Server Blazor Senior Developer

A permanent role involving continuous development, enhancement and maintenance of a large Blazor / MudBlazor / Identity Server application for which I had sole design and development responsibility. This included delivering multiple features, resolving complex issues, and supporting business-critical workflows (see STAR #1 for an example).

In addition to ongoing BAU work, I designed and built a console application to exchange information with a third party and persist the results for display in a Blazor application (see STAR #2).

I also trained and mentored colleagues as the department Blazor subject matter expert, investigated an upgrade of an existing site to Umbraco and regularly wrote SQL scripts to correct non reversible user actions in the company's business critical system.

12/21 - 03/23 : Powwr - Senior Developer C# ASP.NET SQL Server Web Applications

A permanent role involving bug fixing and enhancements in a suite of large and complex web applications. I also created a proof of concept Blazor application and demonstrated this to senior management.

05/21 - 12/21 : Stepstone Ltd - Full Stack Developer

A permanent role involving change requests for various aspects of the company's job websites. This involved C# WebAPI, Unit tests, Moq, React components and a variety of other work.

11/18 - 09/19 : NATS - C# ASP.NET SQL Server Web Application Developer

A contract to develop several applications involving change requests. The most complex of these applications involved six or so stages. I built up very good relationships with the stakeholders for these applications and also wrote detailed documentation for each of the applications.

I introduced the team to Entity Framework, provided multiple EF demonstrations to the team members both as a group and individually, created an EF training application to enable the team to learn how the applications that I created work and assisted other developers with their code.

In a department still using very old style ADO.Net spaghetti code I tried to introduce best practice to reduce the overall codebase and improve code performance.

03/18 – 08/18 : Marston Book Services Ltd – C# ASP.NET Web Application Developer

I was invited back to Marston to assist with preparations for GDPR readiness and a project to implement real-time synchronisation with a third party database.

In addition to this I carried out bug fixes and change requests and continued streamlining the application.

03/16 – 11/17 : Marston Book Services Ltd – C# ASP.NET Web Application Developer

During this contract at Marston I introduced multiple changes to the application including implementing Entity Framework.

In addition to the above I carried out general ongoing feature enhancements and bug fixes and worked to reduce the code overhead wherever possible.

01/14 - 07/15 : Marston Book Services Ltd – C# ASP.NET Web Application Developer

I was invited back to Marston to assist with adding functionality to one of the company's mission critical applications. Amendments included those required to enable the application to comply with new European VAT regulations. I also introduced model binding to the application which further reduced the amount of code and enabled the sorting (and paging if required) of gridviews.

04/13 – 11/13 : Infor – C# ASP.NET SQL Server Developer

A contract to develop an ASP.NET website to interact with legacy technologies that created licence keys for their enterprise software.

10/12 – 03/13 : Romans Group – C# ASP.NET SQL Server Developer

I was invited back to Romans by a Director to be a part of a large and complex mission critical project to redevelop the primary Romans website using Entity Framework, AJAX, the Google Maps API, a great deal of client-side scripting, some WCF services and another third party API.

05/12 – 08/12 : Marston Book Services Ltd – C# ASP.NET Web Application Developer

A contract to add functionality to an intranet application. In addition to specification changes, I introduced object orientation, n-tier design and CSS, cutting development time and improving look and feel. I also made major changes to the data layer which reduced server overheads and recommended security improvements. I also amended SSRS reports.

02/12 – 03/12 : Serversys – C# ASP.NET Web Application Developer

A contract to help complete a CRM system for a major client.

10/11 – 01/12 : Romans Group – C# ASP.NET SQL Server Developer

A contract to develop business-critical web applications.

In many of these applications I suggested, coded, tested and delivered features additional to the Company’s specifications. These were all completed well within the time originally allocated.

Leisure Interests

Travel, classic Mercedes Benz vehicles, photography, industrial archæology, archæology, ornithology, botany, lepidoptery, music, books, the arts.
